

AI Governance & Evidence

Purpose and context

A cross-project capability demonstrated through MIRA, Healthcare AI Analytics and the Professional Portfolio Platform. The shared approach is to record decisions and evidence, check authority and data readiness, require human review at consequential boundaries, and preserve traceable updates. This is a synthesis of existing work, not a separate deployed application.

Approach

- Record sources, decisions, approvals and supporting evidence as work progresses.
- Check whether evidence supports a claim or action; flag missing support instead of guessing.
- Review corrections, update versioned records and preserve the basis for the next handoff.

Documented evidence

- MIRA: documented approval boundaries and a local checkpoint recovery test.
- Healthcare: supported-answer and unsupported-question examples in the saved case study.
- PPP: claim-to-evidence relationships, provenance rules and evidence coverage reports.

Outcome and interpretation

This case study brings together governance practices demonstrated across MIRA, Healthcare AI Analytics, and PPP: human approval, checkpoint recovery, validated answers, and traceable links between claims and supporting evidence.

Scope

Evidence comes from documented prototypes and recorded local test results. Production-wide validation remains a future step.

Evidence status

The companion evidence report identifies the MIRA, Healthcare and PPP records supporting this case study.
