

Data Management

Purpose and context

A graduate data management project connecting company reference and market data with a structured SQL Server warehouse.

Approach

- Normalize reference and time-series data with Python.
- Load SQL Server staging, dimensions and facts.
- Apply constraints and repeatable load scripts.

Documented evidence

- Dimensional data model
- Python normalization scripts
- SQL staging and load design

Outcome and interpretation

Python normalization and SQL staging, dimensions and facts form a repeatable analytical data path. This case study describes the design; it does not claim a new benchmark or production deployment.

Scope and limitations

Graduate warehouse design summary. Source datasets and private course material are not distributed.

Evidence status

Prepared from curated project records. This document summarizes existing work; it is not a fresh test execution or independent certification. The separate evidence report identifies supporting records and any outstanding validation.
