

MIRA - Model-Agnostic AI Workspace

Purpose and context

A model-agnostic workspace designed to connect compatible AI helpers to governed project context through an MCP interface, with a human-facing control center. I directed architecture and governance with AI-assisted implementation. A separate bounded execution pilot demonstrated approval, a fixed Python task and result verification.

Approach

- Define a fixed capability and an approved execution manifest.
- Require human approval and a separate Run action.
- Verify the result against the approved manifest and retained receipt, then persist completion.

Recovery validation milestone

A saved automated-test report records one passing checkpoint recovery and helper/actor handoff test, with three tests deselected. The report describes enforced human approval, resumed checkpoint context, duplicate-free semantic rows on replay and a recorded handoff outcome. This is distinct from the earlier Hello World execution pilot.

Documented evidence

- One fixed Hello World pilot completed on September 6, 2026.
- Result verification and durable completion documented.
- Recovered ingestion checkpoint test demonstrates interruption/hand-off replay safety in portfolio evidence.
- Local prototype only; not unattended production orchestration.

Outcome and interpretation

The saved recovery-test report records checkpoint resume, an enforced human-approval gate, continuation of helper/actor context, duplicate-free semantic rows on event replay, and a traceable handoff result. My role: architecture and governance direction with AI-assisted implementation.

Scope and limitations

Local prototype evidence, not a production deployment. The recovery report records one automated test passing; it does not establish live switching between external LLMs or automatic coordination between separate chat applications. The earlier September 6, 2026 Hello World pilot remains a separate fixed-task milestone. This portfolio update did not rerun either test.

Evidence status

Prepared from curated project records. This document summarizes existing work; it is not a fresh test execution or independent certification. The separate evidence report identifies supporting records and any outstanding validation.
