

Professional Portfolio Platform - Evidence Record

Purpose

Organize professional history, capabilities, project claims and supporting artifacts so they can be reused consistently across a portfolio, résumé and interviews.

Work documented

The project README describes a structured repository and knowledge core, JSON/YAML metadata, curated experience records and a local read-only Streamlit console. The console is documented as exposing recovery state, handoff summaries, review candidates and publication-readiness guidance.

Evidence reviewed

The project README, curated experience pool, master résumé source and saved case-study artifacts were reviewed when preparing this report. These existing records demonstrate a concrete documentation structure, rather than only a proposed portfolio concept.

Observed outcome

The public portfolio draws its project descriptions and evidence summaries from these curated materials. Source records distinguish historical validation, design intent, private material and claims needing further review.

What this supports

Structured professional knowledge organization and reuse of documented claims. It is not evidence of autonomous verification of every career claim.

Limits

No console test suite or live API run was performed for this update. No performance or productivity gain is quantified. Private career records, archive contents and credentials remain outside the public evidence package.
